

Livability Meter 3.0 measurement data 2002-2020

The data for the Leefbaarometer 3.0 are provided in five files; one file containing the scores for each of the five analysis levels:

1. Livability Meter 3.0 - measurement 2020 – scores grid.csv
2. Livability Meter 3.0 - measurement 2020 – scores PC4.csv
3. Livability Meter 3.0 - measurement 2020 – scores buurt.csv
4. Livability Meter 3.0 - measurement 2020 – scores wijk.csv
5. Livability Meter 3.0 - measurement 2020 – scores gemeente.csv

The files have therefore been provided at the municipality, district, neighborhood, four-position postcode (PC4), and grid levels. The municipality, district, and neighborhood levels follow the national classification of Statistics Netherlands (CBS) in 2020. The postcode level follows the classification of PostNL postcodes. The grid level, the lowest scale level, corresponds to the 100x100 meter squares of the CBS.

Each of the five files containing the scores contains, in addition to an identifier and any name of the relevant scale level, the following information:

- 1. version.** The version of the Leefbaarometer scores. The instrument has been recalibrated twice, so this could be Leefbaarometer 1.0, Leefbaarometer 2.0, and Leefbaarometer 3.0.
- 2. Year.** The year of the Leefbaarometer scores. These are the reference years 2002, 2008, 2012, 2014, 2016, 2018, and 2020. The years 2002 and 2008 correspond to the Leefbaarometer 1.0, the years 2012 and 2016 to the Leefbaarometer 2.0, and the years 2014, 2018, and 2020 to the Leefbaarometer 3.0.
- 3. lbm.** This is the Livability Index score.
- 4. Deviation.** This is the deviation of the Leefbaarometer score from the Dutch average in 2018 (the year in which Leefbaarometer 3.0 was calibrated). A positive number therefore corresponds to a higher-than-average livability score, and a negative number to a lower livability score than the average in the Netherlands in 2018.
- 5. Physical.** The score for the dimension 'Physical environment'. The scores for the dimension are shown for the reference years 2014, 2018, and 2020 (Leefbaarometer version 3.0).
- 6. unsatisfactory.** The score of the dimension 'Nuisance & insecurity'. The scores for the dimension are shown for the reference years 2014, 2018 and 2020 (Leefbaarometer version 3.0).
- 7. soc.** The score of the dimension 'Social cohesion'. The scores for the dimension are shown for the reference years 2014, 2018, and 2020 (Leefbaarometer version 3.0).
- 8. vrz.** The score of the 'Facilities' dimension. The scores for the dimension are shown for the reference years 2014, 2018, and 2020 (Leefbaarometer version 3.0).
- 9. won.** The score of the dimension 'Housing stock'. The scores for the dimension are shown for the reference years 2014, 2018, and 2020 (Leefbaarometer version 3.0).

The dimension scores show how the scores on the dimensions relate to the Dutch average and sum to the deviation score in the area (physics + impairment + social skills + occupational health + housing = deviation).

The development of a score can be determined by subtracting the scores in two reference years (i.e. development of Leefbaarometer score between 2014 and 2018 = $lbm[2018] - lbm[2014]$).

Dimension scores are available from Leefbaarometer 3.0, and therefore the trend for these scores can only be mapped for the reference years 2014, 2018, and 2020.

A limited portion of the scores has been suppressed for privacy reasons. To this end, a lower limit has been set on the number of inhabitants in an area. For scores at the municipality, district, neighborhood, or PC4 level, scores for areas with fewer than 100 inhabitants (reference date 1-1-2020) have been suppressed.

Grid scores are suppressed when, according to Statistics Netherlands, fewer than five inhabitants live in the area.
